

# EECS 388: Lab 3

Padding Oracle Attack  
Bleichenbacher Attack

# Current Assignments

Reminder: Canvas quizzes due  
the day before the next lecture

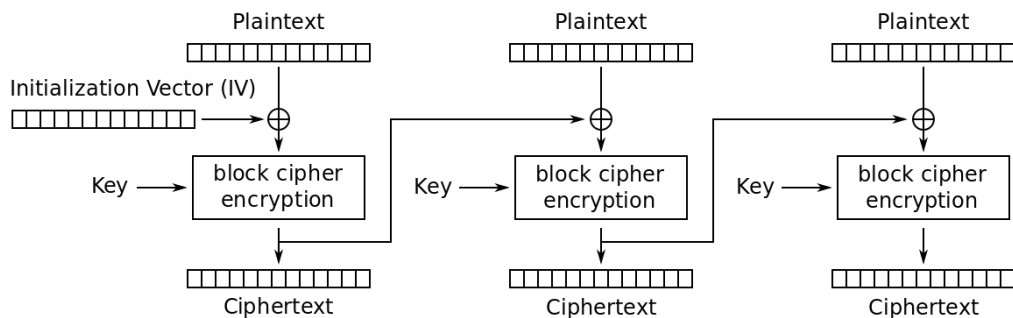

- Project 1 Part 2 due **Thursday, September 19 at 6 p.m.**
  - Padding Oracle Attack
  - Bleichenbacher Attack (RSA signature forgery)

# Padding Oracle Attack

# Cipher Block Chaining (CBC) + MAC-then-Encrypt

- Last block uses padding to fit the block size
- Notoriously hard to implement correctly
- Vulnerable to **Padding Oracle Attack**

- <https://www.youtube.com/watch?v=O5SeQxErXA4>

Cipher Block Chaining (CBC) mode encryption

# Padding

- What if our message is not a multiple of the block size?
- Allows us to use CBC without ambiguity in the resulting message
- PKCS #7

XX	XX	XX	XX	XX	XX	XX	01
----	----	----	----	----	----	----	----

XX	XX	XX	XX	XX	XX	02	02
----	----	----	----	----	----	----	----

XX	07	07	07	07	07	07	07
----	----	----	----	----	----	----	----

08	08	08	08	08	08	08	08
----	----	----	----	----	----	----	----

# XOR Properties

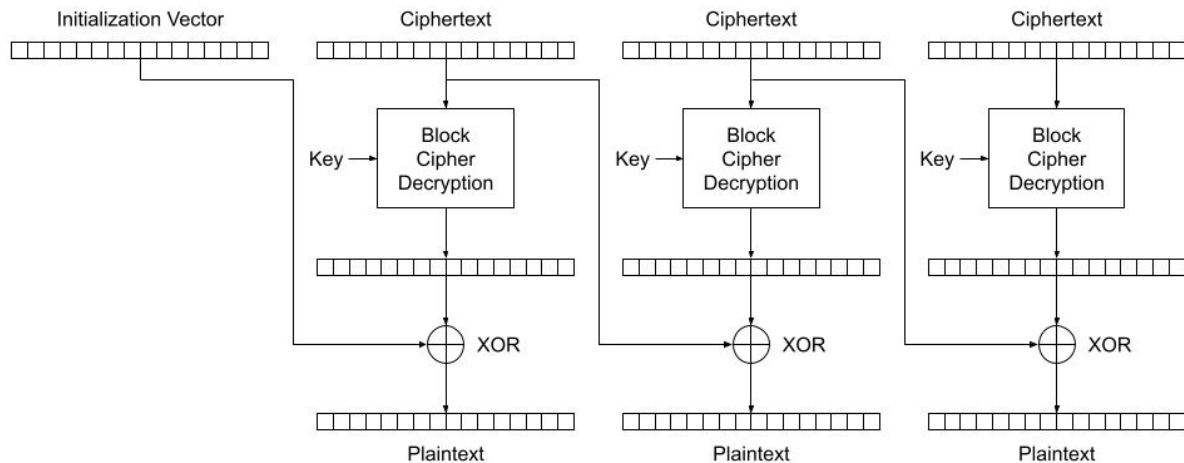

- $A \oplus A = 0$
- $A \oplus 0 = A$
- $A \oplus B = B \oplus A$
- If  $A \oplus B = C$ ,  
    then  $C \oplus B = A$   
    and  $C \oplus A = B$

**XOR truth table**

Input		Output
A	B	
0	0	0
0	1	1
1	0	1
1	1	0

# Padding Oracle Attack!

- You are Mallory and you've just intercepted an encrypted message from Alice to Bob. You know that Alice used CBC.
- Bob's server will tell you whether or not the padding was correct

All Mallory has is ciphertext

Bob decrypts and lets you know if the padding is valid or not

# Padding Oracle Attack!

- Mallory can modify the ciphertext and get feedback from Bob
- Assume Bob is using AES with PKCS #7 padding
  - Last block is padded with the number of padding bytes (R, E, A, L, S, T, U, F, F, 7, 7, 7, 7, 7, 7, 7)
- What can Mallory do with this?

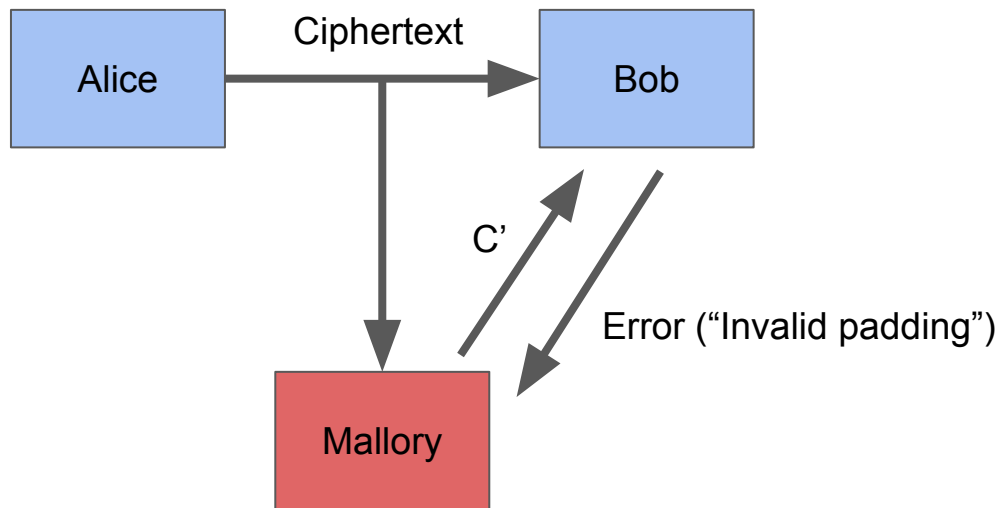

All Mallory has is ciphertext

Bob decrypts and lets you know if the padding is valid or not

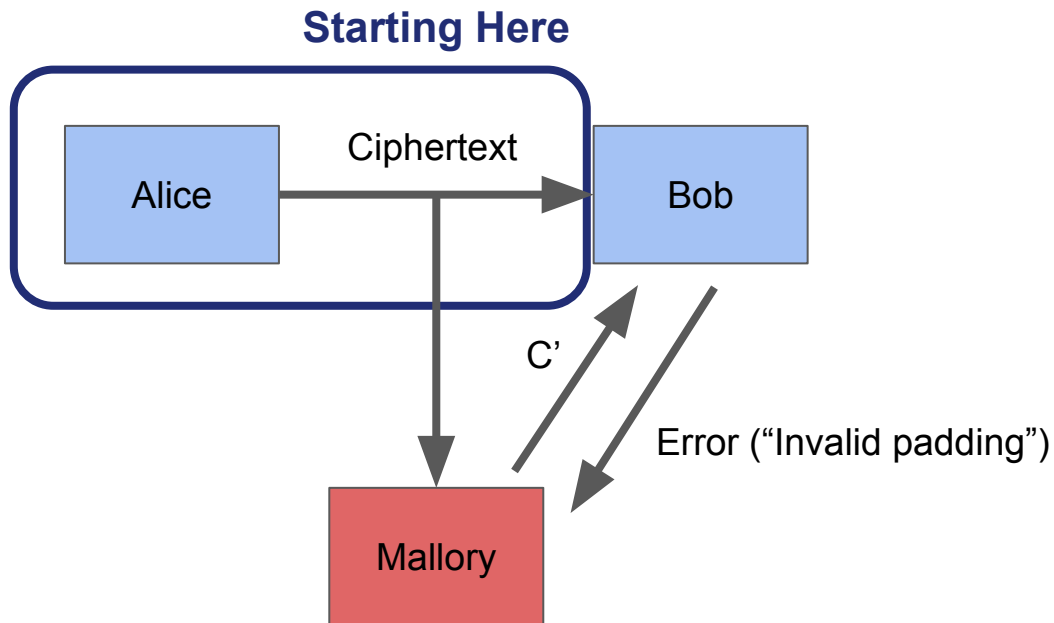

# Premise

- Mallory initially only knows the ciphertext
- Mallory is able to query Bob to incrementally decrypt the ciphertext

# Premise

- Mallory initially only knows the ciphertext
- Mallory is able to query Bob to incrementally decrypt the ciphertext

# Alice's Encryption

Secret Message

Padding Valid

Padding is correct!

Now we know  
we've set P16'  
to 0x01

# Tricky Edge Cases

- What if one of the blocks of Plaintext is 

ED	85	02	FF
----	----	----	----

 ?

- When the last byte is **0x01** OR **0x02**, the block can have valid padding!

ED	85	02	01
----	----	----	----

ED	85	02	02
----	----	----	----

- Other edge cases as well, imagine:

ED	03	03	01
----	----	----	----

ED	03	03	03
----	----	----	----

Padding Valid

(still!)

How can we  
prevent this?

# Project Differences

- 16 byte blocks (4 byte blocks in this example)
- MAC appended to plaintext before padding and block encryption
- New error message from server: **Invalid Mac**
  - Padding is correct, but the MAC is not valid for the message

# Another Edge Case

- Plaintext looks like this →

47	6F	20	42
----	----	----	----

6C	75	65	20
----	----	----	----

21	03	03	03
----	----	----	----

- How will the server respond to the bottom case?

47	6F	20	42
----	----	----	----

6C	75	65	20
----	----	----	----

21	03	03	01

47	6F	20	42
----	----	----	----

6C	75	65	20
----	----	----	----

21	03	02	02
----	----	----	----

?

47	6F	20	42
----	----	----	----

6C	75	65	20
----	----	----	----

21	03	03	03
----	----	----	----

# Bleichenbacher Attack (RSA Signature Forgery)

# Textbook RSA Signatures

## Signing

$$s = m^d \pmod{n}$$

Diagram illustrating the signing process:

- $s$ : signature
- $m$ : message to be signed
- $d$ : private exponent
- $n$ : public modulus

## Verifying

$$s^e = m \pmod{n}$$

Diagram illustrating the verification process:

- $s$ : signature
- $m$ : message that was signed
- $e$ : public exponent
- $n$ : public modulus

See the guts of your own key:

```
$ openssl genrsa -out private.key 4096
$ openssl rsa -in private.key -pubout -out public.key
$ openssl rsa -in private.key -text -noout
$ openssl rsa -in public.key -pubin -text -noout
```

```
generate private
...and public key
print private
...and public key info
```

# Textbook RSA Signatures

- Our good friends Alice and Bob want to communicate with sender authenticity using RSA

$(m, s)$

She sends *both* the message  
*and* the signature

Public:  $(e, N)$

Private:  $d$

Message:  $m$

Signature:  $s = m^d \bmod N$

Verify:  $s^e \bmod N == m$

# A Problem With Textbook RSA

- It's really easy for Mallory to generate a valid  $(m, s)$  pair
- Instead of starting with  $m$  and generating  $s$ , they start with  $s$  and generate  $m$ :

$$m = s^e \bmod N$$

- Fix: Instead of signing  $m$ , we sign **PKCS-PAD**( $m$ )
  - The output of PKCS-PAD follows a very specific format
  - It's infeasible for Mallory to find a value of  $s$  such that  $s^e \bmod N$  will follow this format
  - The PKCS-PAD digest will be the same length for any message

# Bleichenbacher Attack: Vulnerability 1

- So what's Bleichenbacher got to do with it?

$(m, s)$

She sends *both* the message  
*and* the signature

If  $e$  is small enough, we can forge a signature that Bob will verify is correct *without needing to know Alice's private key*. How?

Public:  $(e, N)$

Private:  $d$

Message:  $m$

Signature:  $s = (\text{PKCS-PAD}(m))^d \bmod N$     Verify:  $s^e \bmod N == \text{PKCS-PAD}(m)$

What if  $e$  is really small, like, 3?

# Bleichenbacher Attack: Vulnerability 2

- How should a secure bank's operations work?

$m = \text{"gimme some \$\$\$"}$

$$s = (PKCS\text{-}PAD(m))^d \bmod N$$

- Admin sends the bank's server the  $(m, s)$  pair
- Bank recreates the  $PKCS\text{-}PAD(m)$  using what Admin sent:  $x = PKCS\text{-}PAD(m)$
- Bank raises  $s$  to Admin's public exponent  $e$ :  $y = s^e \bmod N$
- If  $x == y$ , Admin is authenticated

# Bleichenbacher Attack: Vulnerability 2

- How do the bank's operations actually work?

$m = \text{"gimme some \$\$\$"}$

$$s = (\text{PKCS-PAD}(m))^d \bmod N$$

- Admin sends the bank's server the  $(m, s)$  pair
- Bank raises  $s$  to Admin's public exponent  $e$ :  $y = s^e \bmod N$
- Bank parses the SHA-256 digest,  $h$ , from  $y$
- If  $h == \text{SHA-256}(m)$ , Admin is authenticated

# Bleichenbacher Attack

What the result of the signature verification should look like ( $s^e \bmod N$ )

Format of PKCS-PAD( $m$ ) above.

- Lazy implementation
  - Does not count FF bytes; also does not verify hash is in rightmost bytes
- How can we forge something such that ( $s^e \bmod N$ ) gives us the 2nd message seen above?
  - What if  $e$  just so happens to be very small?

Accepted due to poor implementation

# When it doesn't wrap around...

- Let's forge a signature for message  $m$  with  $e = 3$ 
  - How do we make it so that verifying the message gives us  $m \pmod n$ ?
  - How does the "lazy implementation" of checking signatures help with this?

## Signing

signature  $\swarrow$

private exponent  $\swarrow$

public modulus  $\swarrow$

$$s = m^d \pmod n$$

$\nwarrow$  message to be signed

## Verifying

signature  $\swarrow$

public exponent  $\swarrow$

public modulus  $\swarrow$

$$s^e = m \pmod n$$

$\nwarrow$  message that was signed

See you next week!
